SUBSTITUTED (ARYL, HETEROARYL, ARYLMETHYL OR
HETEROARYLMETHYL) HYDROXAMIC ACID COMPOUNDS

10 Field of the Invention

This invention is directed to (aryl, heteroaryl, arylmethyl or heteroarylmethyl)] hydroxamic acid compounds, their preparation, pharmaceutical compositions containing these compounds, and their
15 pharmaceutical use in the treatment of disease states associated with proteins that mediate cellular activity which are capable of being modulated by inhibiting a matrix metalloproteinase (MMP), tumor necrosis factor (TNF) or cyclic AMP phosphodiesterase, or proteins associated therewith that mediate cellular activity. This invention is also directed to intermediates useful in
20 preparing the (aryl, heteroaryl, aralkyl or heteroaralkyl) hydroxamic acid compounds.

Disease states associated with abnormally high physiological levels of cytokines such as TNF are treatable according to the invention. TNF is an
25 important pro-inflammatory cytokine which causes hemorrhagic necrosis of tumors and possesses other important biological activities. TNF is released by activated macrophages, activated T-lymphocytes, natural killer cells, mast cells and basophils, fibroblasts, endothelial cells and brain astrocytes among other cells.

30

The principal in vivo actions of TNF can be broadly classified as inflammatory and catabolic. It has been implicated as a mediator of endotoxic shock, inflammation of joints and of the airways, immune deficiency states, allograft rejection, and in the cachexia associated with malignant disease and
35 some parasitic infections. In view of the association of high serum levels of TNF with poor prognosis in sepsis, graft versus host disease and acute respiratory distress syndrome, and its role in many other immunologic

processes, this factor is regarded as an important mediator of general inflammation.

TNF primes or activates neutrophils, eosinophils, fibroblasts and
5 endothelial cells to release tissue damaging mediators. TNF also activates
monocytes, macrophages and T-lymphocytes to cause the production of colony
stimulating factors and other pro-inflammatory cytokines such IL₁, IL₆, IL₈ and
GM-CSF, which in some case mediate the end effects of TNF. The ability of
TNF to activate T-lymphocytes, monocytes, macrophages and related cells has
10 been implicated in the progression of Human Immunodeficiency Virus (HIV)
infection. In order for these cells to become infected with HIV and for HIV
replication to take place the cells must be maintained in an activated state.
Cytokines such as TNF have been shown to activate HIV replication in
monocytes and macrophages. Features of endotoxic shock such as fever,
15 metabolic acidosis, hypotension and intravascular coagulation are thought to
be mediated through the actions of TNF on the hypothalamus and in reducing
the anti-coagulant activity of vascular endothelial cells. The cachexia
associated with certain disease states is mediated through indirect effects on
protein catabolism. TNF also promotes bone resorption and acute phase
20 protein synthesis.

The discussion herein related to disease states associated with TNF
include those disease states related to the production of TNF itself, and
disease states associated with other cytokines, such as but not limited to IL-1,
25 or IL-6, that are modulated by associated with TNF. For example, a IL-1
associated disease state, where IL-1 production or action is exacerbated or
secreted in response to TNF, would therefore be considered a disease state
associated with TNF. TNF- α and TNF- β are also herein referred to collectively
as "TNF" unless specifically delineated otherwise, since there is a close
30 structural homology between TNF- α (cachectin) and TNF- β (lymphotoxin) and
each of them has a capacity to induce similar biologic responses and bind to
the same cellular receptor.

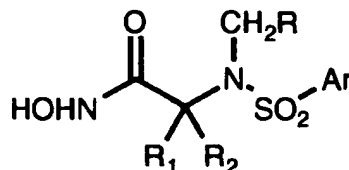

Disease states associated with pathological conditions that are
35 modulated by inhibiting enzymes, which are associated with secondary cellular
messengers, such as cyclic AMP phosphodiesterase are also treatable
according to the invention. Cyclic AMP phosphodiesterase is an important

enzyme which regulates cyclic AMP levels and in turn thereby regulates other important biological reactions. The ability to regulate cyclic AMP phosphodiesterase, including type IV cyclic AMP phosphodiesterase, therefore, has been implicated as being capable of treating assorted biological conditions. In particular, inhibitors of type IV cyclic AMP phosphodiesterase have been implicated as being bronchodilators and asthma-prophylactic agents and as agents for inhibiting eosinophil accumulation and of the function of eosinophils, and for treating other diseases and conditions characterized by, or having an etiology involving, morbid eosinophil accumulation. Inhibitors of cyclic AMP phosphodiesterase are also implicated in treating inflammatory diseases, proliferative skin diseases and conditions associated with cerebral metabolic inhibition.

Disease states associated with the activity of matrix metalloproteinases (MMPs), especially collagenase, stromelysin and gelatinase, or as described by Schwartz MA, Van Wart HE, *Prog. Med. Chem.*, 29, 271-334 (1992) are treatable according to the invention. Thus, the present invention provides compounds of formula I, and compositions containing compounds of formula I, which are of use in a method for treating a patient suffering from, or subject to, conditions which can be ameliorated or prevented by the administration of an inhibitor of an MMP. For example, compounds within the present invention are useful in inhibiting connective tissue breakdown and in the treatment or prophylaxis of conditions involving such tissue breakdown, for example rheumatoid arthritis, osteoarthritis, osteopenias such as osteoporosis, periodontitis, gingivitis, corneal epidermal or gastric ulceration, and tumor metastasis, invasion and growth. Compounds within the scope of the invention as MMP inhibitors may also inhibit the production of TNF (Mohler *et al.*, *Nature*, 370, 218-220 (1994); Gearing AJH *et al.*, *Nature*, 370, 555-557 (1994); McGeehan GM *et al.*, *Nature*, 370, 558-561 (1994)), and, thus are useful in the treatment or prophylaxis of conditions wherein the inhibition of the production or action of TNF are thought to be potentially useful for the treatment or prophylaxis of disease states associated with detrimental amounts of TNF, as described above.

5

General methods for preparing compounds according to the invention may also be prepared as described in the Schemes that follow. The variables in the Schemes are as described above, unless otherwise noted.

10

One procedure for preparing compounds according to the invention, particularly α,α -disubstituted analogs, is shown in Scheme A.

SCHEME A

- 5 For example, a dialkyl malonate such as diethyl (A1) or dimethyl may be monoalkylated using an appropriate alkyl halide ($R_1\text{-Cl}$, $R_1\text{-I}$, $R_1\text{-Br}$, preferably $R_1\text{-I}$, $R_1\text{-Br}$) and a suitable base such as a carbonate (such as sodium or calcium carbonate), hydroxide (such as sodium or potassium hydroxide) or

alkoxide (such as sodium methoxide or ethoxide) in a polar solvent such as ethanol at about 20 to about 90 °C to give A2.

A2 may then be alkylated using another appropriate alkyl halide ($R_2\text{-Cl}$, $R_2\text{-I}$, $R_2\text{-Br}$, preferably $R_2\text{-I}$, $R_2\text{-Br}$), and similar reaction conditions as in the first alkylation to provide A3.

A3 is then deprotected to the corresponding mono acid (A4) by using one equivalent of hydroxide (such as sodium or potassium hydroxide) in an aqueous alcohol or tetrahydrofuran solvent at about 20 to about 90 °C.

The acid moiety of A4 is then reduced selectively using diborane in an organic solvent such as tetrahydrofuran at about 0 to about 40 °C to give the alcohol (A5).

A5 is then be converted to the corresponding sulfonate ester (A6) using a sulfonyl chloride (ClSO_2R_b) such as p-toluenesulfonyl chloride, methanesulfonyl chloride or trifluoromethane sulfonyl chloride and a suitable base such as pyridine or triethylamine in an organic solvent.

The sulfonate ester is then be reacted with a thiol in the presence of a trialkylamine base or hydroxide to give a sulfide (A7).

The sulfide is then oxidized to a sulfone (A8) using a minimum of two equivalents of an oxidant such as oxone, m-chloroperbenzoic acid or hydrogen peroxide.

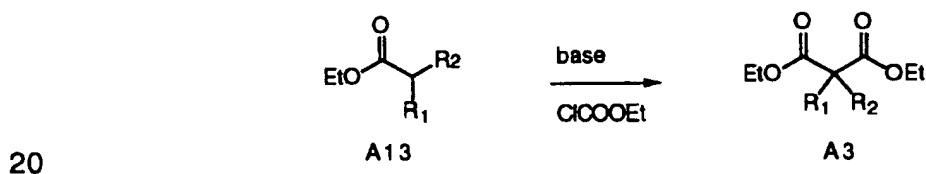

When A8 is α,α -disubstituted then the sulfone may then be alkylated with an alkyl iodide or bromide using a base such as lithium diisopropylamine, lithium bis(trimethylsilyl)amine, sodium bis(trimethylsilyl)amine or *n*-butyllithium in a solvent such as tetrahydrofuran, hexamethylphosphoramide, diethyl ether, dimethoxyethane or a combination thereof at about -75 to about 20 °C to give A9.

A8 and A9 are then converted to the corresponding acids respectively A12 and A10 using hydroxide in an aqueous alcohol or tetrahydrofuran solvent at about 20 to about 90 °C.

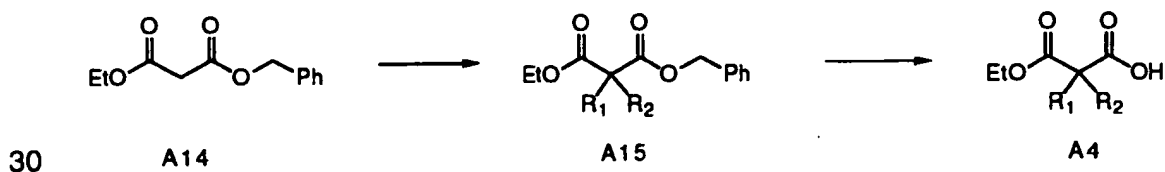

A10 is then reacted using standard peptide coupling procedures with an O-protected hydroxylamine such as O-trimethylsilyl hydroxylamine, O-*t*-butyldimethylsilyl hydroxylamine, O-tetrahydropyranyl hydroxylamine
 5 followed by acid treatment to yield the hydroxamic acid A11.

An alternative sequence for preparing A10 involves alkylating A12 with an alkyl iodide or bromide using two equivalents of a base such as lithium diisopropylamine, lithium bis(trimethylsilyl)amine, sodium bis(trimethylsilyl)-
 10 amine or butyllithium in a solvent such as tetrahydrofuran, hexamethylphosphoramide, diethyl ether, dimethoxyethane or a combination thereof at about 75 to about 20 °C to give A10.

An alternative sequence for preparing A3, particularly where R₁ aryl or heteroaryl, is from A13 by treatment with a suitable base such as trityl sodium, lithium diisopropylamine, lithium bis(trimethylsilyl)amine or sodium bis(trimethylsilyl)amine followed by a chloroformate at about -78 to about 25
 15 °C.

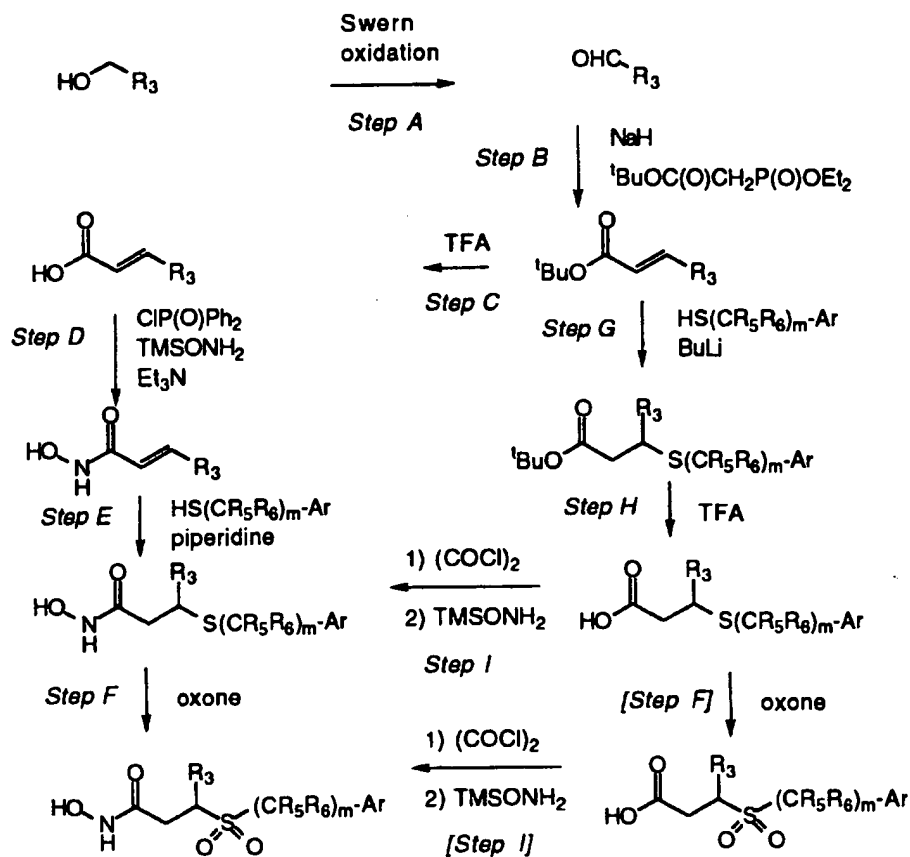

An alternative sequence for preparing A4 involves a mixed ester malonate such as benzyl ethyl malonate (A14). Sequential alkylation using alkyl halide (R₁-I, R₁-Br) followed by (R₂-I, R₂-Br) and a suitable base such as carbonate, sodium hydride, hydroxide or alkoxide in a polar solvent such as ethanol at about 20 to about 90 °C can yield A15. Deprotection of the benzylester to the mono acid A4 may be accomplished using catalytic
 25 hydrogenation.

Another procedure for preparing compounds according to the invention is shown in Scheme B.

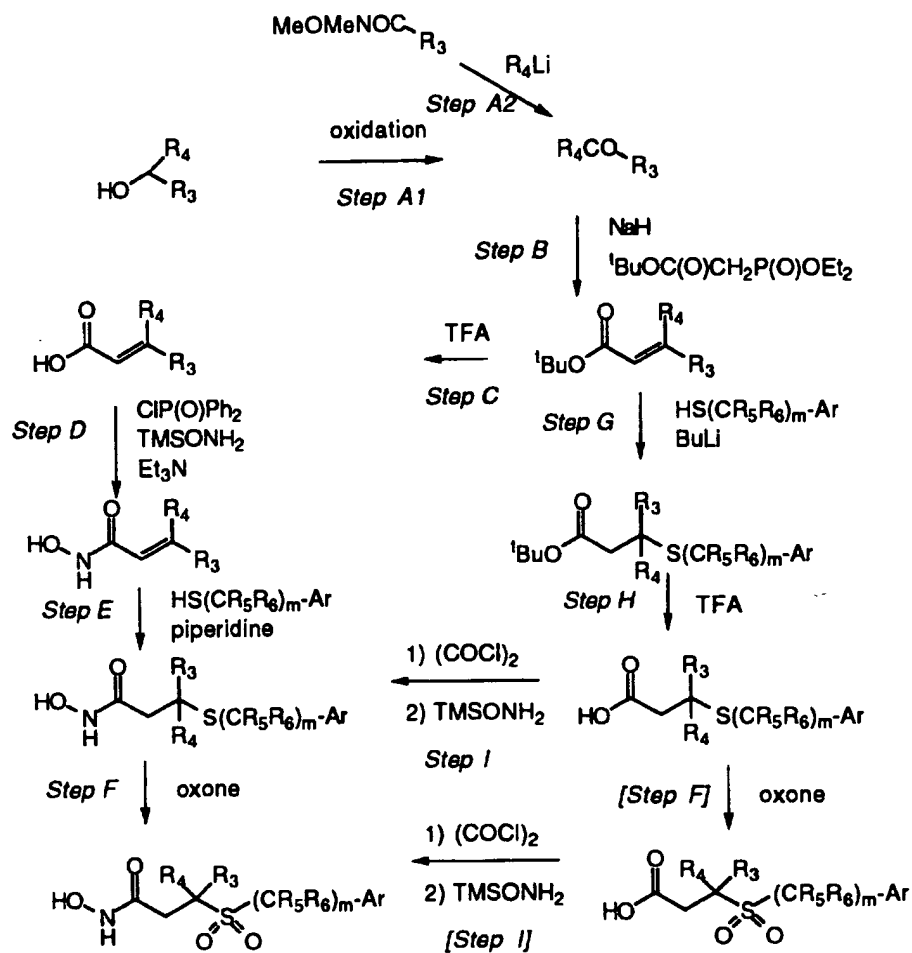

SCHEME B

5

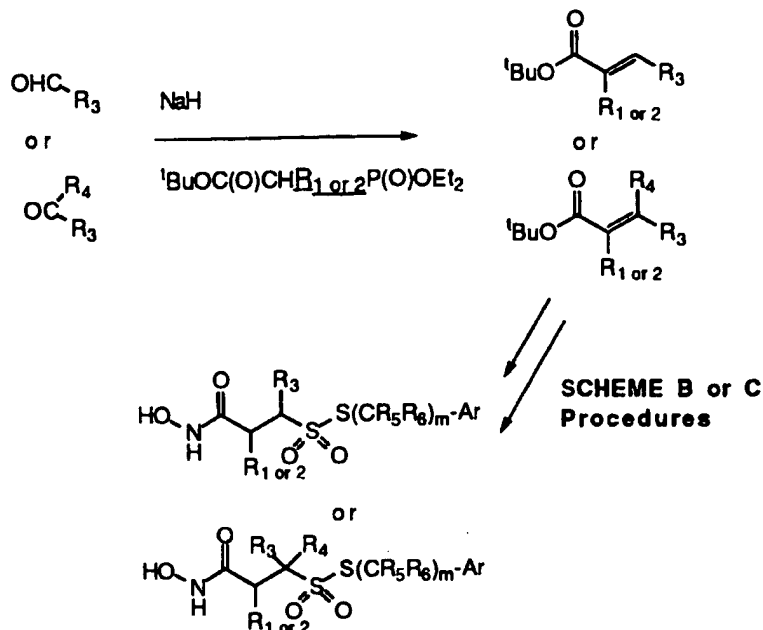

Another procedure for preparing compounds according to the invention is shown in Scheme C.

SCHEME C

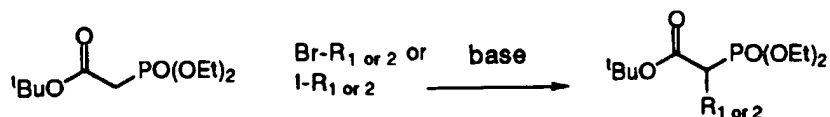

- 5 Following the procedures shown in Scheme B or C, except that the *t*-butyl diethylphosphonoacetate is substituted by a substituted *t*-butyl dialkylphosphonoacetate in step B, then a trisubstituted or tetrasubstituted olefin is produced respectively as shown in Scheme D. Those olefins may then be transformed according to the remaining procedures in Schemes B or C
- 10 to an α -substituted hydroxamic acid.

Scheme D

- 5 An example according to Scheme D, step B may use *t*-butyl diethylphosphonopropionate to prepare a hydroxyamide using the remaining steps as outlined in Scheme A. In addition, a number of substituted *t*-butyl dialkylphosphonoacetates can be prepared by alkylation of *t*-butyl diethylphosphonoacetate with an appropriate alkyl halide in the presence of a
- 10 base such as sodium hydride, lithium diisopropylamine or sodium bis(trimethylsilyl)amine in a solvent such as tetrahydrofuran.

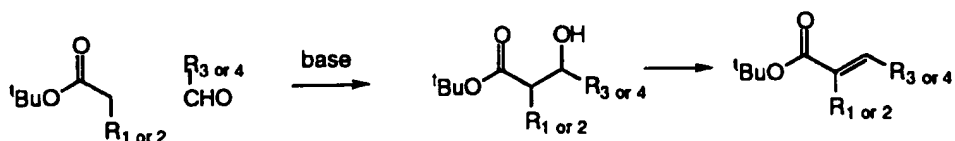

- 15 These phosphonoacetates can then be substituted in step B of Scheme D.

An alternative preparation of trisubstituted olefins is via an aldol reaction followed by elimination of the alcohol. Reaction of a *t*-butyl ester with an aldehyde in the presence of an appropriate base such as lithium

- diisopropylamine, lithium bis(trimethylsilyl)amine, sodium bis(trimethylsilyl)amine or butyllithium in a solvent such as tetrahydrofuran, hexamethylphosphoramide, diethyl ether, dimethoxyethane or a combination thereof at about -75 to about 20 °C may provide the aldol adduct which may be
- 5 treated with a sulfonyl halide such as methanesulfonyl chloride and a trialkylamine base such as triethylamine to provide a sulfonate ester which may be directly eliminated with an additional base such as 1,8-diazabicyclo-[5.4.0]undec-7-ene to give the trisubstituted olefin. This olefin may then be used in Scheme B to yield hydroxamic acids.

- 5 ^aReagents and Conditions: c) 3-(4-methoxyphenylsulfonyl) propionic acid (5 equiv.); 1-(3-dimethylaminopropyl)-3-ethyl carbodiimide hydrochloride (EDCI 5 equiv.); DMF; 25°C; 12 hours. d) 50% TFA in CH_2Cl_2 (100 equiv.); 30 minutes.
- 10 Resin III may then be coupled, as in Scheme AA, Step c, with an acid of formula (Ib), wherein A^1 is $(\text{R}^5\text{R}^6\text{C})_m$ and Ar, n, R^1 , R^2 , R^3 and R^4 are as hereinbefore defined, to give the hydroxamate ester resin (Resin IV). The coupling reaction may conveniently be carried out in the presence of a carbodiimide, such as EDCI, in an inert solvent such as dimethylformamide
- 15 and at about room temperature. Resin IV may then be treated with an acid, such as trifluoroacetic acid, in an inert solvent such as dichloromethane to liberate the hydroxamic acid of formula (Ia).

20 Scheme AB also shows an alternative means for preparing hydroxamic acid compounds within the scope of the invention employing a solid phase.

Scheme AB^a

- 5 A resin such as Resin V may be used to prepare a compound of formula (Ib), wherein Ar, A¹, n, R¹, R², R³ and R⁴ are as hereinbefore defined, as shown in Scheme AC.

Scheme AC

- 5 For example Wang resin (Resin V) is treated, in Scheme AC, Step 1, with diethylphosphonoacetic acid in an inert solvent such as dimethylformamide in the presence of 2,6-dichlorobenzoyl chloride and pyridine at about room temperature to give the esterified resin (Resin VI).
- 10 The diethylphosphonoacetoxo-resin (Resin VI) is treated, in Scheme AC, Step 2, with a base such as potassium bis (trimethylsilyl) amide in an inert solvent such as toluene, at about 0°C, followed by reaction with an aldehyde of formula (II):

wherein R^3 is as defined above, at about room temperature to give the
5 alkenoate resin (Resin VII).

Resin VII may then be reacted, as in Scheme AC, Step 3, with a thiol of
formula (III):

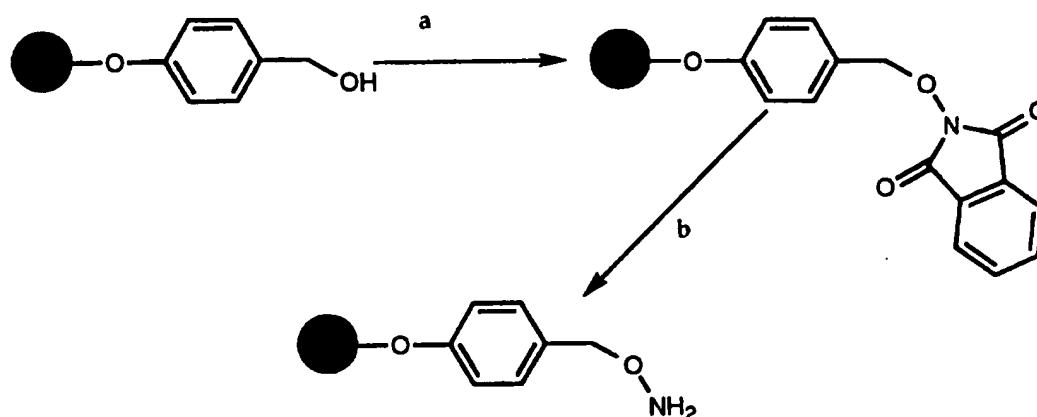

wherein Ar and A^1 are as defined above, to give the alkenoate resin (Resin
VIII). The Michael addition may be conveniently carried out under mild basic
conditions, for example in the presence of lithium hydroxide and at about room
15 temperature.

Resin VIII may then be hydrolyzed by treatment with an acid, such as
trifluoroacetic acid, in an inert solvent such as dichloromethane, to liberate
acids of formula (Ib).
20

Resin VIII may also be treated with an oxidizing agent such as *m*-chloro-
perbenzoic acid in an inert solvent, such as dioxane, and at a temperature at
about room temperature to give Resin IX.

25 Resin IX may then be hydrolyzed by treatment with an acid, such as
trifluoroacetic acid, in an inert solvent such as dichloromethane, to liberate acids
of formula (Ib).

Resin V may also be converted to a hydroxylamine derivatized resin
30 which may also be used in the preparation of compounds within the scope of
the invention. The hydroxylamine derivatized resin is more acid stable and is
synthesized as in Scheme AD.

Scheme AD^a

^aReagents and conditions: a) N-hydroxyphthalimide (5 equiv.); triphenylphosphine (3 equiv.); DIAD (3 equiv.); THF; 0°C to 25°C; 12 hours, b) 40% aq. methylamine (115 equiv.); THF; 40°C; 2 hours.

10

N-hydroxyphthalimide is coupled to the resin using Mitsunobu conditions (Mitsunobu, O., *Synthesis* 1981, 1). The phthalimido protection is removed by methylaminolysis in THF at 40 °C in about 2 hours or hydrazinolysis of the resin swelled in *t*-butanol or THF/*t*-butanol. The use of the methylamine to cleave the phthalimide protection offers a significant advantage over the commonly used hydrazinolysis procedure (Wolf, S. and Hasan, S. K. *Can. J. Chem.* 48, 3572 (1970).

15

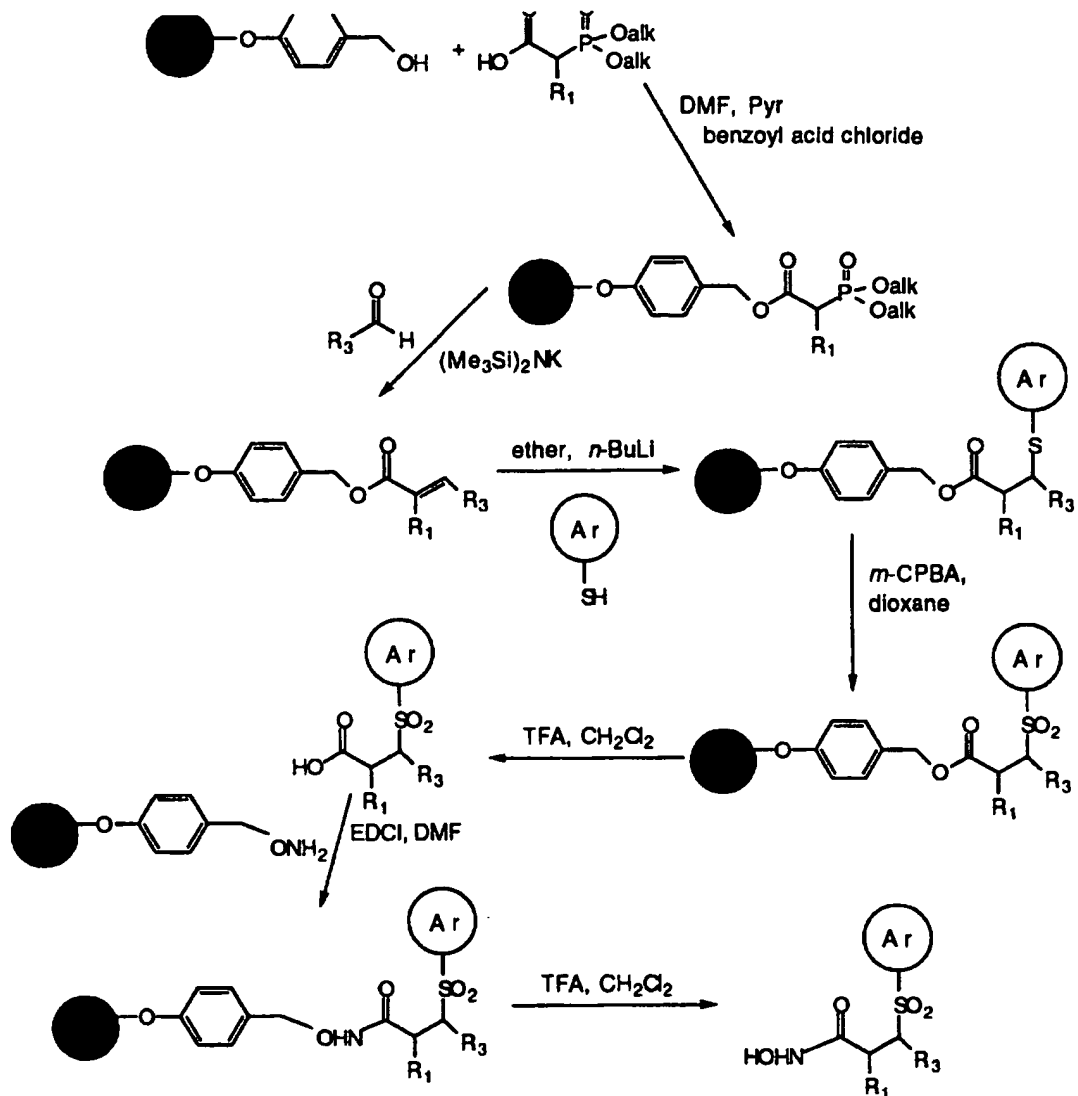

Scheme AE shows a means for preparing hydroxamic acid compounds within the scope of the invention. Carboxylic acids are readily coupled to the resin using procedures similar to those used in solid phase peptide synthesis. Thus, EDCI efficiently couples a carboxylic acid of formula Ib, for example wherein R₁ and R₂ are hydrogen, dissolved in DMF to the resin. The resulting O-resin bound -hydroxamic acid is then released from the solid support by reaction with 10% TFA in DCM for ten minutes. The Rink handle (H. Rink, *Tet.*

20

Lett., 28, 3787-3790, 1987) has the advantage of being cleaved under mild acidolysis for short periods of time (i.e. 10% TFA in DCM for 10-15 minutes.).

Scheme AE

5

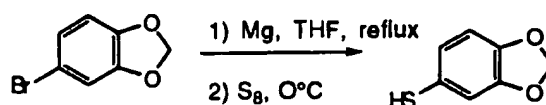

However, due to the cost of the resin it is desirable to synthesize the corresponding functional resin on the Wang solid support ((a) S. S. Wang, *J. Am. Chem. Soc.*, 95, 1328 (1973); b) G. Lu, S. Mojsov, J. P. Tam, and R. B. Merrifield, *J. Org. Chem.*, 46, 3433 (1981)).

Scheme AF

The compounds of the present invention are useful in the form of the free base or acid or in the form of a pharmaceutically acceptable salt thereof. All forms are within the scope of the invention.

Where the compound of the present invention is substituted with a basic moiety, acid addition salts are formed and are simply a more convenient form for use; and in practice, use of the salt form inherently amounts to use of the free base form. The acids which can be used to prepare the acid addition salts include preferably those which produce, when combined with the free base, pharmaceutically acceptable salts, that is, salts whose anions are non-toxic to the patient in pharmaceutical doses of the salts, so that the beneficial inhibitory effects on TNF inherent in the free base are not vitiated by side effects ascribable to the anions. Although pharmaceutically acceptable salts of said basic compounds are preferred, all acid addition salts are useful as sources of the free base form even if the particular salt, per se, is desired only as an intermediate product as, for example, when the salt is formed only for purposes of purification, and identification, or when it is used as intermediate in preparing a pharmaceutically acceptable salt by ion exchange procedures. Pharmaceutically acceptable salts within the scope of the invention are those derived from the following acids: mineral acids such as hydrochloric acid, sulfuric acid, phosphoric acid and sulfamic acid; and organic acids such as acetic acid, citric acid, lactic acid, tartaric acid, malonic acid, methanesulfonic acid, ethanesulfonic acid, benzenesulfonic acid, p-toluenesulfonic acid, cyclohexylsulfamic acid, quinic acid, and the like. The corresponding acid addition salts comprise the following: hydrohalides, e.g. hydrochloride and hydrobromide, sulfate, phosphate, nitrate, sulfamate, acetate, citrate, lactate,

5 tartarate, malonate, oxalate, salicylate, propionate, succinate, fumarate, maleate, methylene-bis- β -hydroxynaphthoates, gentisates, mesylates, isethionates and di-p-toluoyltartratesmethanesulfonate, ethanesulfonate, benzenesulfonate, p-toluenesulfonate, cyclohexylsulfamate and quinate, respectively.

10 According to a further feature of the invention, acid addition salts of the compounds of this invention are prepared by reaction of the free base with the appropriate acid, by the application or adaptation of known methods. For example, the acid addition salts of the compounds of this invention are prepared either by dissolving the free base in aqueous or aqueous-alcohol solution or other suitable solvents containing the appropriate acid and isolating the salt by evaporating the solution, or by reacting the free base and acid in an organic solvent, in which case the salt separates directly or can be obtained by concentration of the solution.

20 The acid addition salts of the compounds of this invention can be regenerated from the salts by the application or adaptation of known methods. For example, parent compounds of the invention can be regenerated from their acid addition salts by treatment with an alkali, e.g. aqueous sodium bicarbonate solution or aqueous ammonia solution.

25 Where the compound of the invention is substituted with an acidic moiety, base addition salts may be formed and are simply a more convenient form for use; and in practice, use of the salt form inherently amounts to use of the free acid form. The bases which can be used to prepare the base addition salts include preferably those which produce, when combined with the free acid, pharmaceutically acceptable salts, that is, salts whose cations are non-toxic to the animal organism in pharmaceutical doses of the salts, so that the beneficial inhibitory effects on TNF inherent in the free acid are not vitiated by side effects ascribable to the cations. Pharmaceutically acceptable salts, including for example alkali and alkaline earth metal salts, within the scope of the invention are those derived from the following bases: sodium hydride, sodium hydroxide, potassium hydroxide, calcium hydroxide, aluminum hydroxide, lithium hydroxide, magnesium hydroxide, zinc hydroxide, ammonia, trimethylammonia, triethylammonia, ethylenediamine, *n*-methyl-glucamine, lysine, arginine, ornithine, choline, N,N'-dibenzylethylenediamine,

chloroprocaine, diethanolamine, procaine, *n*-benzylphenethylamine, diethylamine, piperazine, tris(hydroxymethyl)-aminomethane, tetramethylammonium hydroxide, and the like.

5 Metal salts of compounds of the present invention may be obtained by contacting a hydride, hydroxide, carbonate or similar reactive compound of the chosen metal in an aqueous or organic solvent with the free acid form of the compound. The aqueous solvent employed may be water or it may be a mixture of water with an organic solvent, preferably an alcohol such as
10 methanol or ethanol, a ketone such as acetone, an aliphatic ether such as tetrahydrofuran, or an ester such as ethyl acetate. Such reactions are normally conducted at ambient temperature but they may, if desired, be conducted with heating.

15 Amine salts of compounds of the present invention may be obtained by contacting an amine in an aqueous or organic solvent with the free acid form of the compound. Suitable aqueous solvents include water and mixtures of water with alcohols such as methanol or ethanol, ethers such as tetrahydrofuran, nitriles such as acetonitrile, or ketones such as acetone. Amino acid salts may
20 be similarly prepared.

 The base addition salts of the compounds of this invention can be regenerated from the salts by the application or adaptation of known methods. For example, parent compounds of the invention can be regenerated from their
25 base addition salts by treatment with an acid, e.g. hydrochloric acid.

 As well as being useful in themselves as active compounds, salts of compounds of the invention are useful for the purposes of purification of the compounds, for example by exploitation of the solubility differences between
30 the salts and the parent compounds, side products and/or starting materials by techniques well known to those skilled in the art.

 Compounds of the present invention may contain asymmetric centers. These asymmetric centers may independently be in either the R or S
35 configuration. It will also be apparent to those skilled in the art that certain compounds of formula I may exhibit geometrical isomerism. Geometrical isomers include the cis and trans forms of compounds of the invention having

alkenyl moieties. The present invention comprises the individual geometrical isomers and stereoisomers and mixtures thereof.

5 Such isomers can be separated from their mixtures, by the application or adaptation of known methods, for example chromatographic techniques and recrystallization techniques, or they are separately prepared from the appropriate isomers of their intermediates, for example by the application or adaptation of methods described herein.

10 The starting materials and intermediates are prepared by the application or adaptation of known methods, for example methods as described in the Reference Examples or their obvious chemical equivalents, or by methods described according to the invention herein.

15 The present invention is further exemplified but not limited by the following illustrative examples which illustrate the preparation of the compounds according to the invention.

20 In the nuclear magnetic resonance spectra (NMR) the chemical shifts are expressed in ppm relative to tetramethylsilane. Abbreviations have the following significance: s=singlet; d=doublet; t=triplet; m=multiplet; dd=doublet of doublets; ddd=doublet of doublets of doublets; dt=doublet of triplets, b=broad.

25 Example 1 7-Phenyl-3-phenylsulfonylheptanoic acid hydroxyamide

Step A 5-Phenylpentanal

method 1

30

To a mechanically stirred solution of oxalyl chloride (21.6 g; 170 mmol) in dry CH₂Cl₂ (400 mL) at -78 °C is added DMSO (22.3 g; 360 mmol) dropwise over 45 minutes. After stirring 15 minutes 5-phenylpentanol (25 g; 150 mmol) is added and the internal temperature is allowed to warm to -55 °C. After
35 stirring at this temperature for 30 minutes the reaction is cooled to -78 °C and

triethylamine (104 mL; 750 mmol) is added slowly over 20 minutes. After stirring 15 minutes the reaction bath is removed and the temperature is allowed to warm to 20 °C over 40 minutes. The reaction mixture is then washed with 500 mL water. The water layer is then back-extracted with CH₂Cl₂ (2 x 50 mL).

- 5 The combined organic fractions are washed with 300 mL 2 N HCl, 100 mL water, 200 mL NaHCO₃, 100 mL brine and dried (MgSO₄). The solution is concentrated in vacuo to obtain 5-phenylpentanal (25 g) which is used directly in Step B.

10 method 2

- A solution containing 5-phenylpentanol (10 g, 60 mmol), sodium bromide (6.45 g, 63 mmol) and TEMPO (95 mg, 0.6 mmol) in a 7:7:1 mixture of EtOAc, toluene and water (258 mL) is cooled to 0 °C. With vigorous stirring, an aqueous NaOCl solution (0.35 M, 571 mL, 200 mmol) saturated with NaHCO₃ (43.85 g, 520 mmol) is added in five portions separated by 10 minutes intervals. TLC analysis following the final addition indicated complete reaction. Ethanol (20 mL) is added and the mixture is partitioned between water (500 mL) and EtOAc (500 mL). Aqueous layer is extracted with EtOAc (2 x 500 mL) and combined organic phases are washed successively with 5% aqueous Na₂S₂O₃ (500 mL), water (200 mL) and brine (200 mL) then dried over MgSO₄ and concentrated to afford 5-phenylpentanal as an orange oil which is used without further purification assuming 100% yield. TLC analysis [pet-ether/EtOAc, 9:1, R_f (alcohol) = 0.20, R_f (aldehyde) = 0.60]. ¹H NMR (300 MHz, CDCl₃) δ 1.65 (m, 4H), 2.35 (m, 2H), 2.60 (t, 2H), 7.10-7.30 (m, 5H), 9.75 (s, 1H) ppm.

Step B *t*-butyl 7-phenyl-hept-2-enoate

- 30 *t*-butyl diethylphosphonoacetate (18 g; 70 mmol) is dissolved in dry THF (250 mL) and cooled to -40 °C. NaH (60% in oil; 2.8 g; 70 mmol) is added and

the reaction is warmed to 0 °C. Gas evolution is controlled with cooling and then stirred at 20 °C for 30 minutes. 5-Phenylpentanal (11.3 g; 70 mmol) is added and the reaction stirred 20 minutes. The reaction is concentrated to half volume and petroleum ether (500 mL) is added. The reaction is washed with
5 100 mL water, 100 mL 0.5 N HCl, NaHCO₃, brine and dried (MgSO₄). The solution is concentrated in vacuo to obtain *t*-butyl 7-phenylhept-2-enoate which is used directly in Step C.

Step C 7-Phenyl-hept-2-enoic acid

10

t-butyl 7-phenylhept-2-enoate (19 g; 70 mmol) is dissolved in dry CH₂Cl₂ (120 mL) and trifluoroacetic acid (25 mL) is added slowly. After 5 hours the reaction is concentrated in vacuo and purified by column chromatography using CH₂Cl₂ to obtain 7-phenylhept-2-enoic acid (7 g; 34
15 mmol). ¹H NMR (300 MHz, CDCl₃) δ 12-10 (br, 1H), 7.30-7.24 (m, 2H), 7.20-7.12 (m, 3H), 7.06 (dd, J = 15.7, 7 Hz, 1H), 5.80 (d, J = 15.7 Hz, 1H), 2.62 (t, J = 7.5 HZ, 2H), 2.25 (q, J = 7 HZ, 2H), 1.70-1.61 (m, 2H), 1.56-1.46 (m, 2H).

Step D 7-Phenylhept-2-enoic acid hydroxyamide

20

7-Phenylhept-2-enoic acid (7 g; 34 mmol) is dissolved in dry THF and cooled to 0 °C. Diphenylphosphinic chloride (ClP(O)Ph₂) (7.1 mL; 37 mmol) is added followed by dropwise addition of triethylamine (4.7 mL; 34 mmol). After 45 min at 0 °C, a mixture of O-(trimethylsilyl)hydroxylamine (TMSONH₂) (4.3 g;
25 37 mmol) and triethylamine (4.7 mL; 34 mmol) is added dropwise at 0 °C. The bath is removed and the reaction is allowed to stir at 20 °C for 2 hours. The reaction is then filtered and the solid is extracted with EtOAc (500 mL). The EtOAc is washed with 60 mL 1N HCl, 50 mL brine and dried (MgSO₄). The resulting solution is concentrated in vacuo to yield a white solid which is

purified by titration with Et₂O to obtain 7-phenylhept-2-enoic acid

hydroxyamide (3.9 g; 18 mmol). MS (EI) m/e 219 (M⁺). Anal. (C₁₃H₁₇NO₂) C, H, N.

5 Step E 7-Phenyl-3-phenylsulfanylheptanoic acid hydroxyamide

7-Phenyl-hept-2-enoic acid hydroxyamide (0.3 g; 1.4 mmol) is combined with thiophenol (0.26 g; 2.4 mmol) and piperidine (0.04 g; 0.5 mmol) in 1,4-dioxane (6 mL) and heated to 85 °C for 4 hours. After cooling, the reaction is
10 concentrated in vacuo and purified by column chromatography using 5% MeOH/CH₂Cl₂ to obtain 7-phenyl-3-phenylsulfanylheptanoic acid hydroxyamide.

Step F 7-Phenyl-3-phenylsulfonylheptanoic acid hydroxyamide

15

A solution of 7-phenyl-3-phenylsulfanylheptanoic acid hydroxyamide (0.39 g; 1.2 mmol) in MeOH (8 mL) is cooled to 0 °C and a solution of oxone (1.1 g; 1.8 mmol) in water (8 mL) is added dropwise over 10 minutes. The bath is removed and the reaction is allowed to warm to 20 °C and stir for 16 hours.

20 The mixture is then partitioned between 70 mL of CH₂Cl₂ and 50 mL of water, the aqueous layer is back-extracted (2 X 20 mL), the organic fractions are combined, washed with brine and dried (MgSO₄). The solution is concentrated in vacuo and purified by reverse-phase HPLC using CH₃CN/0.1% TFA to provide pure 7-phenyl-3-phenylsulfonylheptanoic acid

25 hydroxyamide. ¹H NMR (300 MHz, CD₃OD) δ 7.88 (d, J = 7 Hz, 2H), 7.74-7.58 (m, 3H), 7.24-7.08 (m, 5H), 3.66-3.61 (m, 1H), 2.64 (dd, J = 15.2, 4.8 Hz, 1H), 2.50 (t, J = 7.1 Hz, 2H), 2.26 (dd, J = 15.2, 8.4 Hz, 1H), 1.89-1.79 (m, 1H), 1.50-1.27 (m, 5H); MS (FAB) m/e 384 (M+H)⁺. Anal. (C₁₉H₂₃NO₄S) C, H, N.

Alternatively, The product of Step E may be prepared by the following reaction Steps G-I.

5 Step G *t*-butyl 7-phenyl-3-phenylsulfanylheptanoate

t-butyl 7-phenylhept-2-enoate (2 g; 7.7 mmol) and thiophenol (1.2 g; 11 mmol) are dissolved in THF (25 mL) and cooled to 0 °C. *n*-BuLi (2.5 M in hexane; 0.3 mL; 0.7 mmol) is added dropwise and the reaction is allowed to
10 warm and stir at 20 °C for 3 hours. The reaction is concentrated in vacuo and purified by column chromatography using 5% Et₂O/petroleum ether to obtain *t*-butyl 7-phenyl-3-phenylsulfanylheptanoate.

15 Step H 7-Phenyl-3-phenylsulfanylheptanoic acid

To a solution of *t*-butyl 7-phenyl-3-phenylsulfanylheptanoate (1.8 g; 6.5 mmol) in CH₂Cl₂ (20 mL) is slowly added trifluoroacetic acid (6 mL). The reaction is stirred 5 hours and concentrated in vacuo to yield 7-phenyl-3-phenylsulfanylheptanoic acid which is used directly in Step I.

The resulting oil is dissolved in CH₂Cl₂ (20 mL), cooled to 0 °C and O-(trimethylsilyl)hydroxylamine (1.7 g, 16 mmol) is added dropwise. The bath is removed and the reaction is allowed to warm to 20 °C. The reaction is
30 then partitioned between CH₂Cl₂ (100 mL) and 1 N HCl (50 mL), the organic

To a solution of (-)-(1S, 2R)-cis-1-toluenesulfonamide-2-propionyloxy
30 indane (6.4 g, 18 mmol) in CH₂Cl₂ (80 mL), cooled in an ice bath, is added 1 M titanium tetrachloride (21 mL, 21 mmol) dropwise over 10 minutes. This mixture is allowed to come to room temperature and stirred an additional

15 minutes. Then ethyl diisopropylamine (12 mL, 68 mmol) is added over 2 minutes and this mixture is stirred for 1 hour. In another flask, 5-phenylpentanal (5.8 g, 36 mmol) is dissolved in CH_2Cl_2 (90 mL) and 1 M titanium tetrachloride (42 mL, 42 mmol) is added over 6 minutes. The solution is then
5 cooled to -78°C . To this is added the ester enolate dropwise over 35 minutes. This mixture is stirred for 1 hour at -78°C and then quenched with ammonium chloride solution (25 mL). Additional water (100 mL) is added to break up the emulsion that has formed. The layers are separated and the aqueous layer extracted with CH_2Cl_2 (50 mL). The combined organic layers are washed with
10 water (3 x 200 mL) until a pH of 6-7 is obtained and dried over MgSO_4 . The solvent is removed *in vacuo* giving 12 g of residue. Two products are isolated by purification with a Prep 500 HPLC (silica, 38% ether in petroleum ether). The slower eluting material (2 g, 21%) is determined to be the syn-diastereoisomer, which gave compound 8 upon saponification. The faster

20 To a 1-L jacketed reactor with a bottom valve and overhead stirrer (Ace catalog #8090) is charged Wang resin (18.35 g, 20 meq) and anhydrous tetrahydrofuran (THF, 450 mL). This mixture is stirred gently for about 15 minutes, then as much solvent as possible is removed through a tube fitted with a porous glass frit *via* vacuum aspiration. Fresh THF is added, followed by triphenylphosphine (15.74 g, 60 mmol) and N-hydroxyphthalimide (16.31 g, 100 mmol). The resulting mixture is stirred and cooled to -5-0 °C. Diisopropyl azodicarboxylate (11.8 mL, 60 mmol) is added slowly so as to maintain the temperature at <5 °C. When the addition is complete, the stirred mixture is allowed to warm slowly to room temperature and stirred overnight. As much of the reaction liquors as possible is removed by aspiration through the dip tube as above. The resin is washed by charging N,N-dimethylformamide (DMF,

200 mL), stirring the mixture for 3–5 minutes, and then removing by aspiration as much of the wash solution as possible. Similarly, the resin is washed sequentially with an additional portion of DMF and portions of methanol (twice), THF (twice), and methanol (once). A portion of the resin may be removed for
5 analysis: IR 1734 cm⁻¹ (C=O).

To the resin remaining in the reactor is added THF (400 mL) and 200 mL of a 40% aqueous solution of methylamine (2.31 mol). This reaction mixture is stirred gently at 40 °C for 2 hours, then cooled to room temperature (the
10 mixture may be held overnight at this temperature). As much of the reaction liquors as possible is removed by aspiration, and the resin is washed with the solvent array as above. Following the final methanol wash, additional methanol is used to flush the resin out of the bottom of the reactor and isolate it by filtration. The filtered resin is dried at NMT 40 °C under vacuum. Yield 18–
15 18.5 g resin: amine load 1.02 meq/g (based on potentiometric titration of a THF suspension with p-toluenesulfonic acid); IR (microscopy) 3316 cm⁻¹ (w, -NH₂). Analysis found C, 87.07%; H, 7.77%; N, 1.58%, which corresponds to 1.13 nitrogen atoms/g resin.

20 Assay of resin:

Preparation of 4-nitrophenylethanehydroxamic acid. A 200 mg sample of the dried resin (ca. 0.2 mmol) is charged to a 5- or 10-mL resin reactor (a polypropylene syringe barrel fitted with a polypropylene frit). The resin is
25 swelled for about 15 minutes in dry DMF, and then 115 mg 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDCI, 0.6 mmol) is added. To this mixture is then added 4-nitrophenylacetic acid (115 mg, 0.6 mmol). The reactor is capped and the mixture is agitated slowly overnight (a rocker bed apparatus is used). The reaction liquors are removed by vacuum filtration (the
30 resin reactor is inserted through a small rubber vacuum flask adapter), and the resin is washed by several small (2–3 mL) portions of the following solvents: DMF (4–5 portions), MeOH or 50% aq. DMF (3–4 portions), THF (3–4

portions), and MeOH (2–3 portions). The resin (still in the syringe reactor) is dried for at least 4 hours under vacuum at NMT 40 °C.

To this dried resin is added 2 mL dichloromethane (DCM) followed by
5 2 mL trifluoroacetic acid (TFA). Additionally, 20 mL water is added (believed to reduce “anhydride” formation from hydroxamic acid product). The mixture is allowed to react for about 1 hr, and the reaction liquors are drained into a tared collector. The resin is washed with 1–2 1-mL portions of DCM followed by 1–2 1-mL portions of toluene. The combined filtrates are concentrated to about
10 2 mL at NMT 30 °C, 2 mL additional toluene is added, and the resulting solution is concentrated to dryness under vacuum (rotary evaporator followed by vacuum oven at NMT 30 °C; note that heating in the presence of TFA promotes formation of the “anhydride” impurity). The residue is weighed and analyzed for weight % purity (HPLC, using the carboxylic acid as a response
15 factor standard). Typical results for 4-nitrophenylethanehydroxamic acid: 29–30 mg solids at 60–70 wt% purity, 90–97 A% purity (261 nm); ¹H NMR (CD₃OD) δ 8.13 (d, 2H), 7.25 (d, 2H), 4.85 (bs, OH, NH), 3.55 (s, 2H); ¹³C NMR δ 169.4, 144.3, 131.3, 124.6, 40.2. This reflects a load/clip chemical yield of 50–55% from resin at 1 meq/g.

30 The compounds of formula I exhibit useful pharmacological activity and accordingly are incorporated into pharmaceutical compositions and used in the treatment of patients suffering from certain medical disorders.

More especially, compounds within the scope of the invention are cyclic AMP phosphodiesterase inhibitors, in particular type IV cyclic AMP phosphodiesterase inhibitors. The present invention provides compounds of formula I, and compositions containing compounds of formula I, which are of use in a method for the treatment of a patient suffering from, or subject to, conditions which can be ameliorated or prevented by the administration of an inhibitor of cyclic AMP phosphodiesterase, especially type IV cyclic AMP phosphodiesterase. For example, compounds within the present invention are useful as bronchodilators and asthma-prophylactic agents and agents for the inhibition of eosinophil accumulation and of the function of eosinophils, e.g., for the treatment of inflammatory airways disease, especially reversible airway obstruction or asthma, and for the treatment of other diseases and conditions characterized by, or having an etiology involving, morbid eosinophil accumulation. As further examples of conditions which may be ameliorated or prevented by the administration of inhibitors of cyclic AMP phosphodiesterase, such as compounds of formula I, there may be mentioned inflammatory diseases, such as atopic dermatitis, urticaria, allergic rhinitis, psoriasis, rheumatic arthritis, ulcerative colitis, Crohn's disease, adult respiratory distress syndrome and diabetes insipidus, other proliferative skin diseases such as keratosis and various types of dermatitis, conditions associated with cerebral metabolic inhibition, such as cerebral senility, multi-infarct dementia, senile dementia (Alzheimer's disease), and memory impairment associated with Parkinson's disease, and conditions ameliorated by neuroprotectant activity, such as cardiac arrest, stroke, and intermittent claudication.

25

Additionally, compounds within the scope of the invention are also inhibitors of tumor necrosis factor, especially TNF- α . Thus, the present invention provides compounds of formula I, and compositions containing compounds of formula I, which are of use in a method for treating a patient suffering from, or subject to, conditions which can be ameliorated or prevented by the administration of an inhibitor of TNF- α . For example compounds of the present invention are useful in inflammatory, infectious, immunological or malignant diseases. For example, compounds according to the invention are useful in treating joint inflammation, including arthritis, rheumatoid arthritis and other arthritic conditions such as rheumatoid spondylitis and osteoarthritis. Additionally, the compounds are useful in treatment of Crohn's disease, haemodynamic shock, psoriasis, congestive heart failure, fibrotic disease,

35

multiple sclerosis, radiation damage, toxicity following administration of immunosuppressive monoclonal antibodies such as OKT3 or CAMPATH-1 and hypertoxic alveolar injury, sepsis syndrome, septic shock, gram negative sepsis, toxic shock syndrome, acute respiratory distress syndrome, asthma and
5 other chronic pulmonary diseases, bone resorption diseases, reperfusion injury, graft vs. host reaction, allograft rejection and leprosy. Furthermore, the compounds are useful in the treatment of infections such as viral infections and parasitic infections, for example malaria such as cerebral malaria, mycobacterial infection, meningitis, fever and myalgias due to infection, HIV,
10 AIDS, cachexia such as cachexia secondary to AIDS or to cancer. cachexia,.

Another group of conditions which may be treated with the compounds of formula I includes diseases and disorders of the central nervous system such as brain trauma, ischaemia, Huntington's disease and tardive
15 dyskinesia.

Other disease states that may be treated with the compounds of formula I include Crohn's disease, ulcerative colitis, pyresis, systemic lupus erythematosus, multiple sclerosis, type I diabetes mellitus, psoriasis, Beçhet's
20 disease, anaphylactoid purpura nephritis, chronic glomerulonephritis, inflammatory bowel disease and leukemia.

A special embodiment of the therapeutic methods of the present invention is the treating of asthma. Another special embodiment of the
25 therapeutic methods of the present invention is the treating of joint inflammation.

In addition, compounds within the scope of the invention are inhibitors of matrix metalloproteinases (MMPs), especially collagenase, stromelysin and
30 gelatinase, or as described by Schwartz MA, Van Wart HE, *Prog. Med. Chem.*, 29, 271-334 (1992). Thus, the present invention provides compounds of formula I, and compositions containing compounds of formula I, which are of use in a method for treating a patient suffering from, or subject to, conditions which can be ameliorated or prevented by the administration of an inhibitor of
35 an MMP. The treatment or prophylaxis of pathological conditions such as tissue breakdown, for example rheumatoid arthritis, osteoarthritis, osteopenias

such as osteoporosis, periodontitis, gingivitis, corneal epidermal or gastric ulceration, and tumor metastasis, invasion and growth may be mediated by an inhibitor of an MMP. MMP inhibitors also inhibit the production of TNF, and, thus are useful in the treatment or prophylaxis of conditions which inhibit the
5 production or action of TNF such as in the treatment or prophylaxis of disease states associated with detrimental amounts of TNF, as described above.

Since excessive TNF production has been noted in several diseases or conditions also characterized by MMP-mediated tissue degradation,
10 compounds which inhibit both MMPs and TNF production may have particular advantages in the treatment or prophylaxis of diseases or conditions in which both mechanisms are involved.

According to a further feature of the invention there is provided a method
15 for the treatment of a human or animal patient suffering from, or subject to, conditions which may be ameliorated or prevented by the administration of an inhibitor of cyclic AMP phosphodiesterase, especially type IV cyclic AMP phosphodiesterase, or of TNF, especially TNF- α , or of an MMP, for example conditions as hereinbefore described, which comprises the administration to
20 the patient of an effective amount of compound of formula I or a composition containing a compound of formula I. "Effective amount" is meant to describe an amount of compound of the present invention effective in inhibiting cyclic AMP phosphodiesterase and/or TNF and thus producing the desired therapeutic effect.

25

Reference herein to treatment should be understood to include prophylactic therapy as well as treatment of established conditions.

The present invention also includes within its scope pharmaceutical
30 compositions which comprise pharmaceutically acceptable amount of at least one of the compounds of formula I in association with a pharmaceutically acceptable carrier or excipient.

In practice compounds or compositions for treating according to the
35 present invention may administered by any suitable means, for example, by

inhalation, topically, parenterally, rectally or orally, but they are preferably administered orally.

The compounds of formula I may be presented in forms permitting
5 administration by the most suitable route and the invention also relates to pharmaceutical compositions containing at least one compound according to the invention which are suitable for use in human or veterinary medicine. These compositions may be prepared according to the customary methods, using one or more pharmaceutically acceptable adjuvants or excipients. The
10 adjuvants comprise, inter alia, diluents, sterile aqueous media and the various non-toxic organic solvents. The compositions may be presented in the form of tablets, pills, granules, powders, aqueous solutions or suspensions, injectable solutions, elixirs or syrups, and may contain one or more agents chosen from the group comprising sweeteners, flavorings, colorings, or stabilizers in order
15 to obtain pharmaceutically acceptable preparations.

The choice of vehicle and the content of active substance in the vehicle are generally determined in accordance with the solubility and chemical properties of the product, the particular mode of administration and the
20 provisions to be observed in pharmaceutical practice. For example, excipients such as lactose, sodium citrate, calcium carbonate, dicalcium phosphate and disintegrating agents such as starch, alginic acids and certain complex silica gels combined with lubricants such as magnesium stearate, sodium lauryl sulfate and talc may be used for preparing tablets. To prepare a capsule, it is
25 advantageous to use lactose and high molecular weight polyethylene glycols. When aqueous suspensions are used they may contain emulsifying agents or agents which facilitate suspension. Diluents such as sucrose, ethanol, polyethylene glycol, propylene glycol, glycerol and chloroform or mixtures thereof may also be used.

30 For parenteral administration, emulsions, suspensions or solutions of the compounds according to the invention in vegetable oil, for example sesame oil, groundnut oil or olive oil, or aqueous-organic solutions such as water and propylene glycol, injectable organic esters such as ethyl oleate, as
35 well as sterile aqueous solutions of the pharmaceutically acceptable salts, are used. The solutions of the salts of the products according to the invention are especially useful for administration by intramuscular or subcutaneous injection.

The aqueous solutions, also comprising solutions of the salts in pure distilled water, may be used for intravenous administration with the proviso that their pH is suitably adjusted, that they are judiciously buffered and rendered isotonic with a sufficient quantity of glucose or sodium chloride and that they are
5 sterilized by heating, irradiation and/or microfiltration.

Topical administration, gels (water or alcohol based), creams or ointments containing compounds of the invention may be used. Compounds of the invention may be also incorporated in a gel or matrix base for application in
10 a patch, which would allow a controlled release of compound through transdermal barrier.

For administration by inhalation, compounds of the invention may be dissolved or suspended in a suitable carrier for use in a nebulizer or a
15 suspension or solution aerosol, or may be absorbed or adsorbed onto a suitable solid carrier for use in a dry powder inhaler.

Solid compositions for rectal administration include suppositories formulated in accordance with known methods and containing at least one
20 compound of formula I.

The percentage of active ingredient in the compositions of the invention may be varied, it being necessary that it should constitute a proportion such that a suitable dosage shall be obtained. Obviously, several unit dosage forms
25 may be administered at about the same time. A dose employed may be determined by a physician or qualified medical professional, and depends upon the desired therapeutic effect, the route of administration and the duration of the treatment, and the condition of the patient. In the adult, the doses are generally from about 0.001 to about 50, preferably about 0.001 to about 5,
30 mg/kg body weight per day by inhalation, from about 0.01 to about 100, preferably 0.1 to 70, more especially 0.5 to 10, mg/kg body weight per day by oral administration, and from about 0.001 to about 10, preferably 0.01 to 1, mg/kg body weight per day by intravenous administration. In each particular case, the doses are determined in accordance with the factors distinctive to the
35 patient to be treated, such as age, weight, general state of health and other characteristics which can influence the efficacy of the compound according to the invention.

The compounds according to the invention may be administered as frequently as necessary in order to obtain the desired therapeutic effect. Some patients may respond rapidly to a higher or lower dose and may find much weaker maintenance doses adequate. For other patients, it may be necessary to have long-term treatments at the rate of 1 to 4 doses per day, in accordance with the physiological requirements of each particular patient. Generally, the active product may be administered orally 1 to 4 times per day. Of course, for other patients, it will be necessary to prescribe not more than one or two doses per day.

The compounds of the present invention may also be formulated for use in conjunction with other therapeutic agents such as agents which increase cyclic AMP production including β -agonists and PGE_2 . It is understood that the present invention includes combinations of compounds of the present invention with one or more of the aforementioned therapeutic agents

Compounds within the scope of the present invention exhibit marked pharmacological activities according to tests described in the literature which tests results are believed to correlate to pharmacological activity in humans and other mammals. The following pharmacological in vitro and in vivo test results are typical for characterizing compounds of the present invention.

IN VITRO AND IN VIVO TEST PROCEDURES

1. (a) Inhibitory effects of compounds on PDE IV activity.

1.1 Preparation of PDE from guinea pig macrophages.

The method is described in Turner et al. Br. J. Pharmacol., 108, 876 (1993). Briefly, cells are harvested from the peritoneal cavity of horse-serum treated (0.5 mL i.p.) Dunkin Hartley guinea pigs (250-400 g) and the macrophages purified by discontinuous (55%, 65%, 70% v/v) gradient (Percoll) centrifugation. Washed macrophages are plated out in cell culture flasks and allowed to adhere. The cells are washed with Hank's balanced salt solution, scraped from the flasks and centrifuged (1000 g). The supernatant is removed

and the pellets stored at -80°C until use. The pellet is homogenized in 20 mM tris(hydroxymethyl)aminomethane HCl, pH 7.5, 2 mM magnesium chloride, 1 mM dithiothreitol, 5 mM ethylenediaminetetraacetic acid, 0.25 mM sucrose, 20 mM p-tosyl-L-lysine chloromethyl ketone, 10 mg/mL leupeptin and 2000
5 U/mL aprotinin.

1.2 Measurement of PDE activity.

PDE activity is determined in macrophage homogenates by the two-step
10 radioisotopic method of Thompson et al., (Adv. Cyclic Nucl. Res., 10, 69 (1979). The reaction mixture contains 20 mM tris(hydroxymethyl)aminomethane HCl (pH 8), 10 mM magnesium chloride, 4 mM 2-mercaptoethanol, 0.2 mM ethylenebis(oxyethylenitrilo)tetraacetic acid and 0.05 mg of bovine serum albumin/mL. The concentration of substrate is 1 μ M. The IC₅₀ values (i.e.
15 concentrations which produce 50% inhibition of substrate hydrolysis) for the compounds examined are determined from concentration-response curves in which concentrations range from 0.01 nM to 40 μ M.

1.3 Preparation of PDE from human platelets.

20

The method is described in R.E. Weishaar et al. (Biochem. Pharmacol., 35, 787 (1986).

1.4 Measurement of PDE activity.

25

PDE activity is determined by the radioisotopic method of Thompson et al., (Adv. Cyclic Nucl. Res., 10, 69 (1979). Following incubation for 30 minutes at 30°C [³H]-Guanosine 5'-monophosphate is separated from the substrate, guanosine [³H]-guanosine 3':5'-cyclic monophosphate, by elution on
30 cation-exchange columns, and radioactivity is determined using a liquid scintillation counter (LS 1701, Beckman) using a liquid scintillation cocktail (Flow Scint III, Packard). The concentration of substrate is 1 μ M. The IC₅₀ values (i.e. concentrations which produce 50% inhibition of substrate hydrolysis) for the compounds examined are determined from
35 concentration-response curves in which concentrations range from 10⁻¹¹M to 10⁻⁵M.

2. In vivo bronchodilator actions of compounds.

2.1 Measurement of bronchodilation.

5 Bronchorelaxant activity is measured in in vivo tests in the anaesthetized guinea-pig or rat according to the method described in Underwood et al., *Pulm. Pharmacol.* 5, 203 (1992) in which the effects on bronchospasm induced by histamine (or other spasmogens such as methacholine or leukotriene D₄) is determined. Compounds are administered orally 1 hour prior to administration
10 of spasmogen.

3. In vivo actions of compounds on antigen (ovalbamin)-induced eosinophilia in guinea-pigs.

15 3.1 Treatment of animals and measurement of eosinophil numbers.

Male Dunkin-Hartley guinea-pigs weighing 200-250g are sensitized using 10 µg ovalbumin in 1 mL of a 100 mg/mL suspension of aluminum hydroxide, i.p. 28 days after sensitization guinea-pigs are dosed orally. 23 Hours later this procedure is repeated and 60 minutes later the guinea-pigs are
20 challenged with nebulized saline or ovalbumin (1% in saline) for 15 seconds. 24 Hours after challenge the guinea-pigs are killed and the lungs are lavaged with warm saline. Total and differential cell counts are made.

25 4. Inhibitory effects of compounds against antigen-induced eosinophilia in the rat *in vivo*.

4.1. Treatment of rats and measurement of eosinophil numbers.

Male Brown Norway rats weighing 150-250 g are sensitized on days 0,
30 12 and 21 with ovalbumin (100 µg, i.p.). Rats are challenged on any one day between days 27-32. 24 hours and 1 hour before antigen challenge rats are dosed orally. Rats are challenged by exposure for 30 minutes to Nebulized saline or ovalbumin (1% in saline). 24 hours after challenge, rats are killed and the airways are lavaged with physiological salt solution. Total and
35 differential cell counts are made.

5. In Vitro Inhibitory Effects on TNF- α Release by Human Monocytes

The effects of compounds on TNF- α production by human peripheral blood monocytes (PBMs) are examined as follows.

5

5.1. Preparation of blood leukocytes.

Blood is drawn from normal donors, mixed with dextran, and the erythrocytes allowed to sediment for 35 minutes at 37°C. Leukocytes are fractionated by centrifugation through a discontinuous (18, 20 and 22%) metrizamide gradient. The mononuclear cell fraction comprising 30-40% PBMs is suspended in Hank's balanced salt solution and stored at 4°C until use.

15 5.2. Measurement of TNF- α .

Cells from the PBM-rich metrizamide fraction are spun down (200 g for 10 minutes at 20°C), resuspended at 10^6 PBMs/mL of medium; RPMI 1640 containing 1%v/v FCS, 50U/mL penicillin and 50 mg/mL streptomycin (Gibco, U.K.), then plated out in 96 well plates at 2×10^5 cells/well. The medium (200 μ L) is changed to remove any non-adherent cells and the remaining, adherent PBMs left in the incubator overnight (18 hours). One hour prior to challenge, the medium is changed to that containing compound for test or drug vehicle. Control treatments and compounds for test are assayed in quadruplicate wells. Compounds are tested within the concentration range of 3×10^{-10} M to 3×10^{-6} M. Medium (50 μ L) with or without 10 ng/mL LPS (E. Coli, 055 B5 from Sigma, U.K.) is then added. The incubation is then continued for a further 4 hours. Cell supernatants are removed for storage at -20°C.

30 TNF- α levels in cell supernatants are quantified using a standard sandwich ELISA technique. ELISA plates (Costar, U.K.) are coated overnight at 4°C with 3 mg/mL polyclonal goat anti-human TNF- α antibody (British Biotechnology, U.K.) in pH 9.9 bicarbonate buffer. Rabbit polyclonal anti-human TNF- α antiserum (Janssen Biochimica, Belgium) at 1/500 dilution is used as the second antibody and polyclonal goat anti-rabbit IgG horseradish peroxidase (Calbiochem, U.S.A.) at 1/8000 dilution is used as the detection antibody. Color development is measured by absorbance at 450 nm using a Titek plate reader.

TNF- α levels are calculated by interpolation from a standard curve using recombinant human TNF- α (British Biotechnology U.K.)(0.125-8 ng/mL). Data (log-conc. vs. log-resp) are fitted by linear regression ($p > 0.99$) using a
5 Multicalc (Wallac Pharmacia, U.K.) software program. Basal TNF- α levels are less than 100 pg/mL whilst LPS (lipopolysaccharide) stimulation of the PBMs increases TNF- α levels to 3-10 ng/mL.

5.3 Results.

10 Compounds within the scope of the invention produce inhibition of induced TNF- α release from human PBMs at concentrations from about 0.01 nM to about 10 μ M.

15 6. Inhibitory effects of compounds on antigen-induced bronchoconstriction in the conscious guinea-pig.

6.1. Sensitization of guinea-pigs and measurement of antigen-induced bronchoconstriction.

20 Male Dunkin-Hartley guinea-pigs (550-700 g) are sensitized as above. Specific airways resistance (SRaw) is measured in conscious animals by whole body plethysmography using a variation of the method of Pennock et al., J. Appl. Physiol., 46,399 (1979). Test compounds or vehicle are administered orally 24 hours and 1 hour before antigen challenge. 30 Minutes before
25 challenge the animals are injected with mepyramine (30 mg/kg i.p.) to prevent anaphylactic collapse and placed into the plethysmography chambers where SRaw is determined at 1 minute intervals. Resting SRaw is then determined. Animals are challenged with an aerosol of ovalbumin and SRaw is determined every 5 minutes for 15 minutes.

30 7. Inhibitory effects of compounds against antigen-induced bronchoconstriction in the anaesthetized rat *in vivo*.

35 7.1. Treatment of rats and measurement of antigen-induced bronchoconstriction.

Male Brown Norway rats weighing 150-250 g are sensitized on days 0, 12 and 21 with ovalbumin (100 μ g, i.p.). Rats are challenged on any one day between days 27-32. 24 hours and 1 hour before antigen challenge rats are

dosed orally. Rats are anaesthetized to allow recording of lung function (airway resistance and lung compliance) using respiratory mechanics software. Rats are challenged with ovalbumin i.v. and the peak changes in airway resistance and lung compliance are determined.

5

8. Inhibitory effects of compounds on serum TNF- α levels in LPS-challenged mice.

8.1. Treatment of animals and measurement of murine TNF- α .

- 10 Female Balb/c mice (age 6-8 weeks, weight 20-22 g from Charles River, U.K.) in groups of five or more animals are dosed p.o. with compounds suspended in 1.5% (w/v) carboxymethyl cellulose then challenged after a minimum period of 30 minutes with 30 mg of LPS i.p. After 90 minutes the animals are killed by carbon dioxide asphyxiation and bled by cardiac
- 15 puncture. Blood is allowed to clot at 4°C, centrifuged (12,000 g for 5 minutes) and serum taken for TNF- α analysis. TNF- α levels are measured using a commercially available murine TNF- α ELISA kit, purchased from Genzyme (Cat. no. 1509.00), as recommended by the manufacturer. Values for TNF- α are calculated from a recombinant murine TNF- α standard curve.

20

9. Systemic bioavailability in female Balb/c mouse.
Intravenous administration :

- 25 Following surgery to expose the jugular vein for dosing, a solution of test compound in dimethylsulphoxide is added at a dose of 1 mg/kg body weight.
Oral administration :

- 30 A suspension of test compound in 1.5% aqueous carboxymethylcellulose is introduced into the stomach by gavage at a dose of 1 mg/kg body weight. Following either i.v. or oral dosing, blood is obtained by cardiac puncture following carbon dioxide asphyxiation and is obtained at a single time post-dose for each animal. Three animals are sacrificed at each time point. Blood samples are obtained at the following times after dosing by both the i.v. and oral routes; 5 minutes (i.v. only), 0.25, 0.5, 1, 2, 3, 4, 5.5, 7 and

24 hours. Corresponding plasma is obtained by centrifugation of each blood sample. The drug content in the plasma samples is then determined using conventional methods.

5 9.1 Metabolism.

(i) Preparation of mouse liver homogenate

Fresh mouse liver is homogenized in sucrose-phosphate buffer. Following centrifugation the resulting supernatant (liver homogenate) is used
10 fresh or frozen in liquid nitrogen for one minute and stored at -30°C to -40°C prior to use.

(ii) Incubation of compounds with mouse liver homogenate

15 To 0.5 mL of mouse liver homogenate is added 0.5 mL taken from a vortexed mixture of 8 mg NADPH added to a mixture of aqueous magnesium chloride (1 mL, 0.15 M) nicotinamide (1 mL, 0.5M) and pH 7.4 tris buffer (8.5 mL, 0.1 M). The compound is added at a concentration of 1 mg/mL in 10 mL of solvent. Incubates are maintained at 37°C. Samples are taken at 0 minutes, 5
20 minutes, 10 minutes, 20 minutes and 30 minutes and the incubation stopped by the addition of 100 mL acetonitrile. The drug content in the incubation samples is determined using conventional methods.

10. Streptococcal Cell Wall-Induced Arthritis in Rats.

25 10.1 Preparation of *S. pyogenes* purified cell wall.

Purified *S. pyogenes* cell wall is prepared from the cell pellet of a log-phase culture of *S. pyogenes*, group A, strain D-58. The whole bacteria are homogenized by grinding with glass beads and the crude cell wall
30 collected by centrifugation and subsequently washed with 2% sodium dodecyl sulphate in phosphate buffered saline followed by phosphate buffered saline to remove contaminating proteins and nucleic acids. The cell wall is further purified by sonication and differential centrifugation to obtain a purified preparation which pelleted at 100,000 g. This material is suspended in sterile
35 phosphate buffered saline and the quantity of cell wall determined by measuring the rhamnose content of the preparation (purified cell wall contains

28% rhamnose by weight). The material is filtered through a 0.22 μ m filter and stored at 4°C until used for arthritis induction.

10.2 Arthritis Induction and measurement of joint diameters.

5

Female Lewis rats weighing 140-160 g are injected intra-articularly into the left or right tibio-tarsal joint on day 0 with purified *S. pyogenes* cell wall extract (10 mg in 10 mL sterile saline). On day 20, rats received an intravenous injection of purified cell wall (100 mg in 100 mL sterile saline) via the lateral vein of the tail. Joint diameters are measured with calipers across the lateral and medial malleoli of the previously intra-articularly injected joint immediately prior to the i.v. injection and then daily through day 24. The net joint diameter is determined by subtracting the value for the contralateral joint. Body weights are also measured daily. Compounds or vehicle are administered by oral gavage on days 20-23. Typically, 8-10 animals are used per group. For each dose, the total daily dose is divided into two equal aliquots which are given at approximately 9 a.m. and 3 p.m.
